ANVL-LDP-2.8	pass	pass	pass	pass	pass	pass
MUST	NEGATIVE RFC 3036, s1.2 p6 LDP Message Exchange LDP Message Exchange and Structure LDP uses the TCP transport for session, advertisement and notification messages; i.e., for everything but the UDP-based discovery mechanism.					
ANVL-LDP-2.9	pass	pass	pass	pass	pass	pass
MUST	RFC 3036, s1.3 p7 LDP Message Structure LDP Message Exchange and Structure The Value part of a TLV-encoded object, or TLV for short, may itself contain one or more TLVs. (DUT Receiving TLV)					
ANVL-LDP-3.3	FAIL	pass	pass	pass	pass	pass
MUST	RFC 3036, s2.1 p8 FECs RFC 3036, s2.1 p8 FECs LDP Operation--FECs and Label Spaces, Identifiers, Sessions and Transport We say that a particular address "matches" a particular address prefix if and only if that address begins with that prefix. We also say that a particular packet matches a particular LSP if and only if that LSP has an Address Prefix FEC element which matches the packet's destination address.					
ANVL-LDP-3.8	FAIL	pass	pass	pass	pass	pass
MUST	RFC 3036, s2.1 p9 FECs LDP Operation--FECs and Label Spaces, Identifiers, Sessions and Transport If a packet matches multiple LSPs, it is mapped to the LSP whose matching prefix is the longest.					

LDP Results

	Master 2017-01-16 --- Ubuntu 16.04	Stable 2.0-rc1 --- Ubuntu 16.04	Stable 2.0-rc2 --- Ubuntu 16.04	Master 2017-02-24 --- Ubuntu 16.04	Master 2017-03-07 --- Ubuntu 16.04	Release 2.0 --- Ubuntu 16.04
ANVL-LDP-3.9	FAIL	pass	pass	pass	pass	pass
MUST	RFC 3036, s2.1 p9 FECs					
	LDP Operation--FECs and Label Spaces, Identifiers, Sessions and Transport If there is no one LSP whose matching prefix is longest, the packet is mapped to one from the set of LSPs whose matching prefix is longer than the others.					
ANVL-LDP-3.12	FAIL	FAIL	FAIL	FAIL	FAIL	FAIL
MUST	RFC 3036, s2.1 p9 FECs					
	LDP Operation--FECs and Label Spaces, Identifiers, Sessions and Transport A packet may match two LSPs, one with a Host Address FEC element and one with an Address Prefix FEC element; the packet is always assigned to the former.					
ANVL-LDP-3.16	pass	pass	pass	pass	pass	pass
MUST	RFC 3036, s2.2.2 p10 LDP Identifiers					
	LDP Operation--FECs and Label Spaces, Identifiers, Sessions and Transport The first four octets of the LDP Identifier octets identify the LSR and must be a globally unique value, such as a 32-bit router Id the LSR.					
ANVL-LDP-3.18	pass	pass	pass	pass	pass	pass
MUST	RFC 3036, s2.2.2 p10 LDP Identifiers					
	LDP Operation--FECs and Label Spaces, Identifiers, Sessions and Transport The last two octets of LDP Identifiers for platform-wide label spaces are always both zero. (Note: this test is only valid for devices with platform-wide label spaces, and as such requires a LAN interface)					
ANVL-LDP-3.21	pass	pass	pass	pass	pass	pass
MUST	RFC 3036, s2.2.4 p11 LDP Transport					
	LDP Operation--FECs and Label Spaces, Identifiers, Sessions and Transport LDP uses TCP as a reliable transport for sessions.

ANVL-LDP-15.4	pass	pass	pass	pass	pass	pass
MUST	NEGATIVE RFC 3036, s3.1 p31 LDP PDUs					
	Protocol Specification--PDUs and FEC TLVs Each LDP PDU is an LDP header followed by one or more LDP messages.					
ANVL-LDP-15.5	pass	pass	pass	pass	pass	pass
MUST	RFC 3036, s3.1 p31-32 LDP PDUs					
	Protocol Specification--PDUs and FEC TLVs Validate LDP Header from DUT. * Version: This version of the specification specifies LDP protocol version 1. * PDU Length: Two octet integer specifying the total length of this PDU in octets, excluding the Version and PDU Length fields. The maximum allowable PDU Length is negotiable when an LDP session is initialized. Prior to completion of the negotiation the maximum allowable length is 4096 bytes. * LDP Identifier: The first four octets identify the LSR and must be a globally unique value. It should be a 32-bit router Id assigned to the LSR and also used to identify it in loop detection Path Vectors. The last two octets identify a label space within the LSR. For a platform-wide label space, these should both be zero.					
ANVL-LDP-15.7	pass	pass	pass	pass	pass	pass
MUST	RFC 3036, s3.3 p32-33 Type-Length-Value Encoding					
	Protocol Specification--PDUs and FEC TLVs Validate LDP TLV encoding from DUT. An LDP TLV is encoded as a 2 octet field that uses 14 bits to specify a Type and 2 bits to specify behavior when an LSR doesn't recognize the Type, followed by a 2 octet Length Field, followed by a variable length Value field.
